

DAVITA POST TRANSPLANT HEALTH

Advance Transplant Success

Post Transplant Health supports and monitors patients to thrive beyond transplant

Successful kidney transplantation goes beyond the surgery — it requires expertly managing post-transplant challenges to support lasting kidney health. We help protect patients' new kidneys for the long term, so your team can focus on pre-transplant and transplant care.

How It Works

The Post Transplant program, part of DaVita Transplant Health, is dedicated to helping transplant recipients maximize the health and longevity of their new kidney.

Once patients are stable, DaVita's dedicated transplant team provides:

Proactive outreach and scheduling

Protocolized care: customized and approved by your program

Adjustment of immunosuppressants per protocols

Lab work and in-person evaluations by an NP at a DaVita center

Education on the importance of routine post transplant care

Care coordination activities

Re-referrals and escalations: customized by your program

Seamless data exchange via Epic®

Value to Transplant Programs

- Enables your program to focus on pre-transplant, transplant, and immediate post-transplant care
- Includes standardized escalation paths and a clearly defined triage model
- Closely monitors patients for completion of essential screenings and appointments
- Offers in-person care with lab work and NP follow-ups in a single visit
- Care coordination across patients, transplant programs, and community nephrologists
- Streamline data collection for data submission and quality reporting

Through close collaboration with transplant nephrologists, the Post Transplant Health program aims to make a differential impact on transplant success. The program's proactive care design will help ensure a patient's kidney function changes do not go undetected and intervention is prompt when they occur.

To learn more about DaVita's Post Transplant Health program, please email us at PostTransplantHealth@davita.com.

Value to Community Nephrologists

Time with the patient spent on medical decision making versus data collection

Support patients in coordinating visits with their local nephrologist

Structured notes and aggregated patient health data throughout the year

Value to Patients

Local, in-person care model supporting patients with labs and medications

Conveniently located in DaVita clinics for easy patient access

Support team that closely monitors health and intervenes as needed
